

Data Sets for the Sorting Complexity Project

To help you with generating data, two C++ program files `number_data.h` and `number_data.cpp` are given to you; study and make use of them in your homework. You may integrate them into your programs (perhaps preferred) or use the given program to generate numbers written to one or more output files and then use the files. Whatever you do, you **MUST** make sure each of the candidate sorting algorithms starts with the same random data sets (for each of the four sizes), the same descending order data sets (for each of the four sizes), and the same sorted data set (of 8000 elements) for the experimentation to be meaningful.
